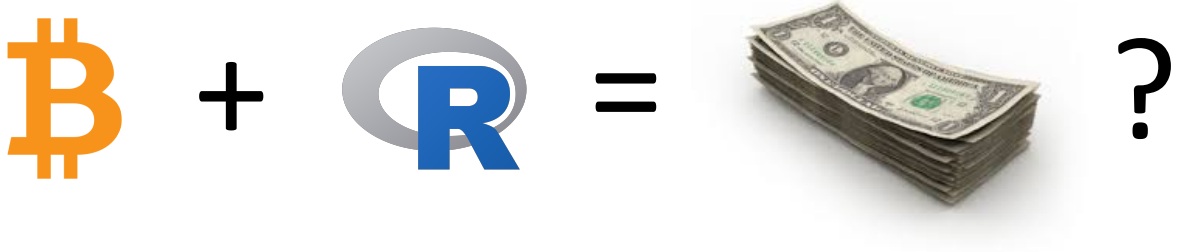
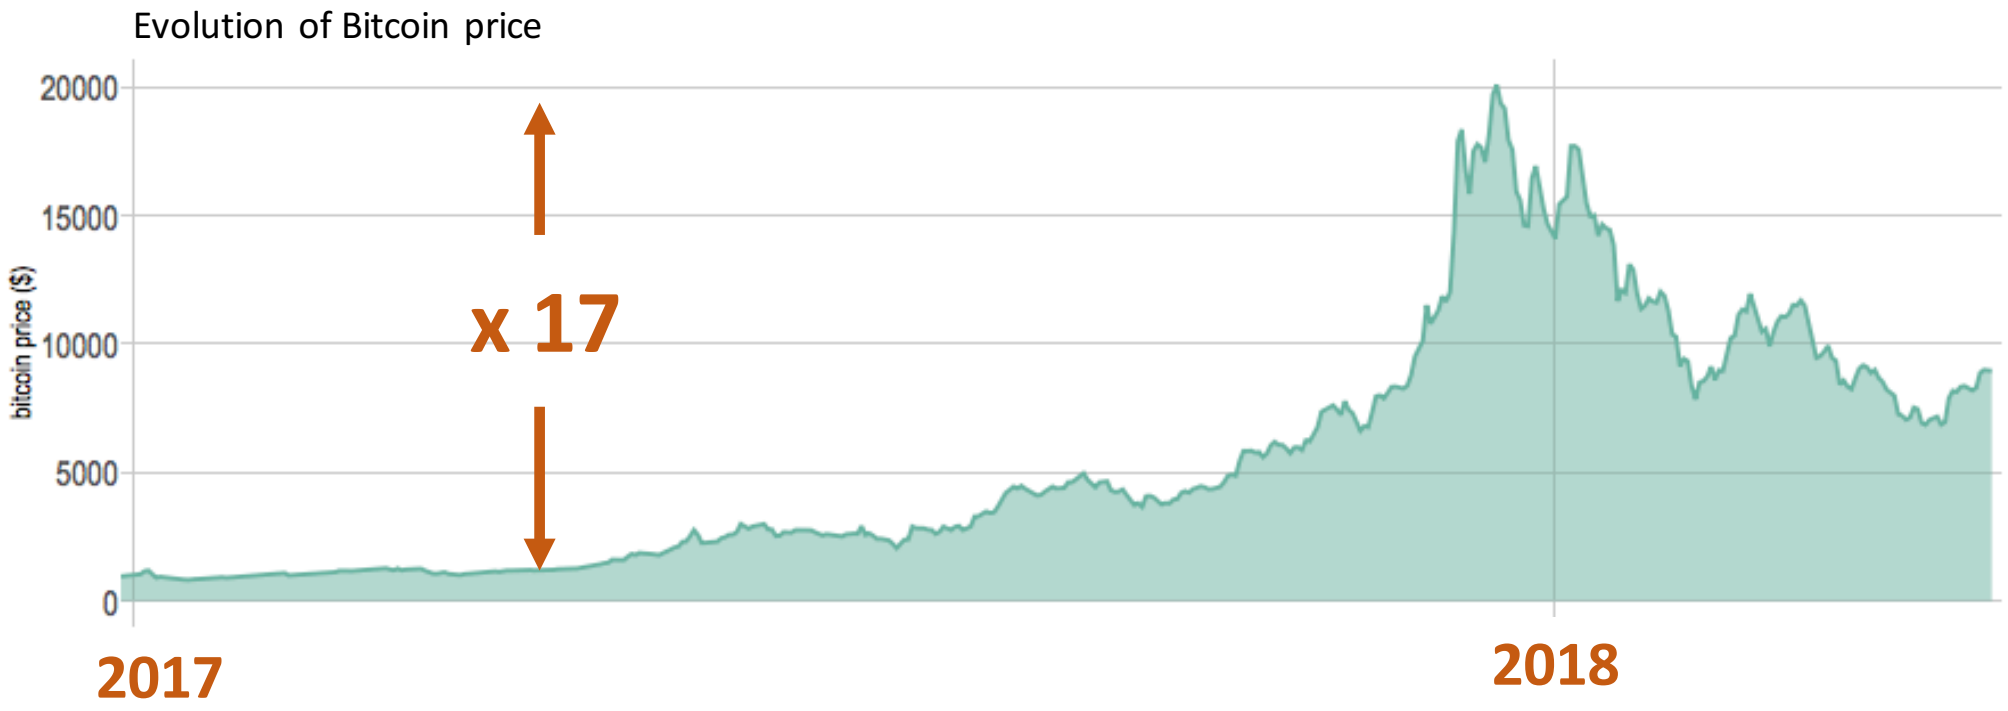
GETTING RICH QUICK WITH R AND CRYPTOCURRENCIES ?

---

github.com/holtzy/Cryp-To



Crypto Currency <- Digital asset



Several **Currencies** exist:

Bitcoin

Etherum

Bitcoin Cash

Bought and sold on **Exchanges**

Bitstamp

kraken

CEX·IO

coinbase

BITFINEX

Several **Currencies** exist:

Bitcoin

Etherum

Bitcoin Cash

Bought and sold on **Exchanges**

Bitstamp

coinbase

BITFINEX

What is arbitrage ?

What is arbitrage ?

1 € → →  → → 1.1 €

Exchange A
Price = 1€ / kg

Exchange B
Price = 1.1€ / kg

PART I – Investigating price differences

Harvesting data

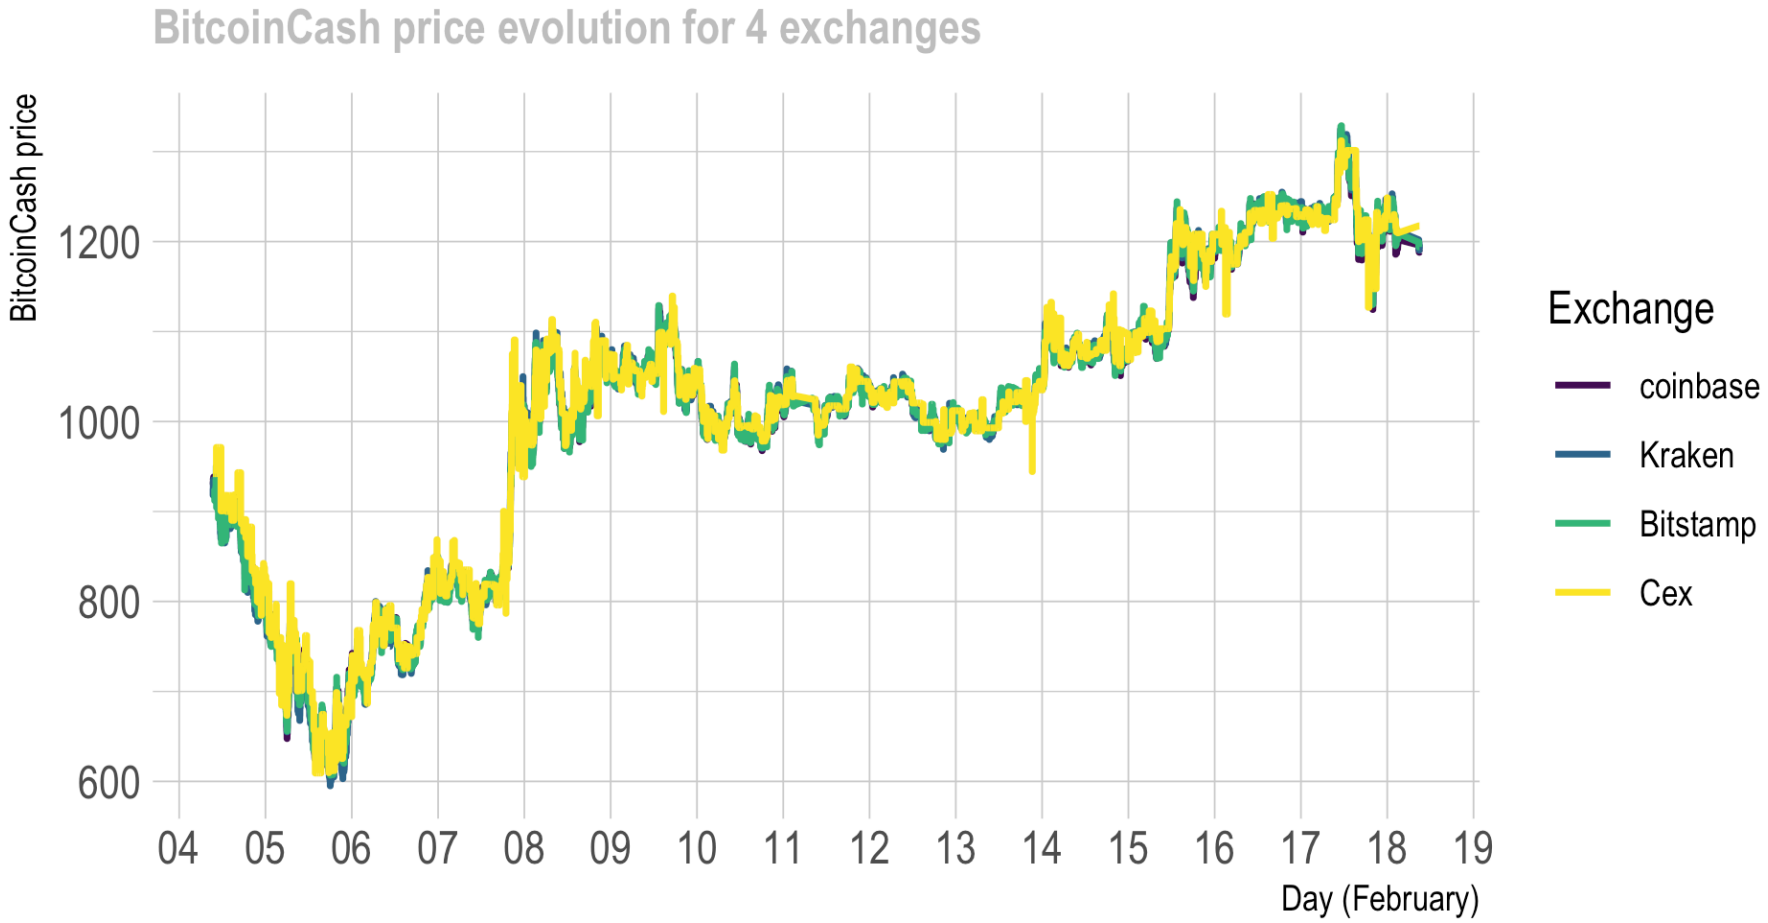
- Use R to get price at time <- t

```
# Recover the information
library(RCurl)
adress <- "https://api.kraken.com/0/public/Ticker?pair=BTCEUR"
ticker <- getURLContent(adress)
```

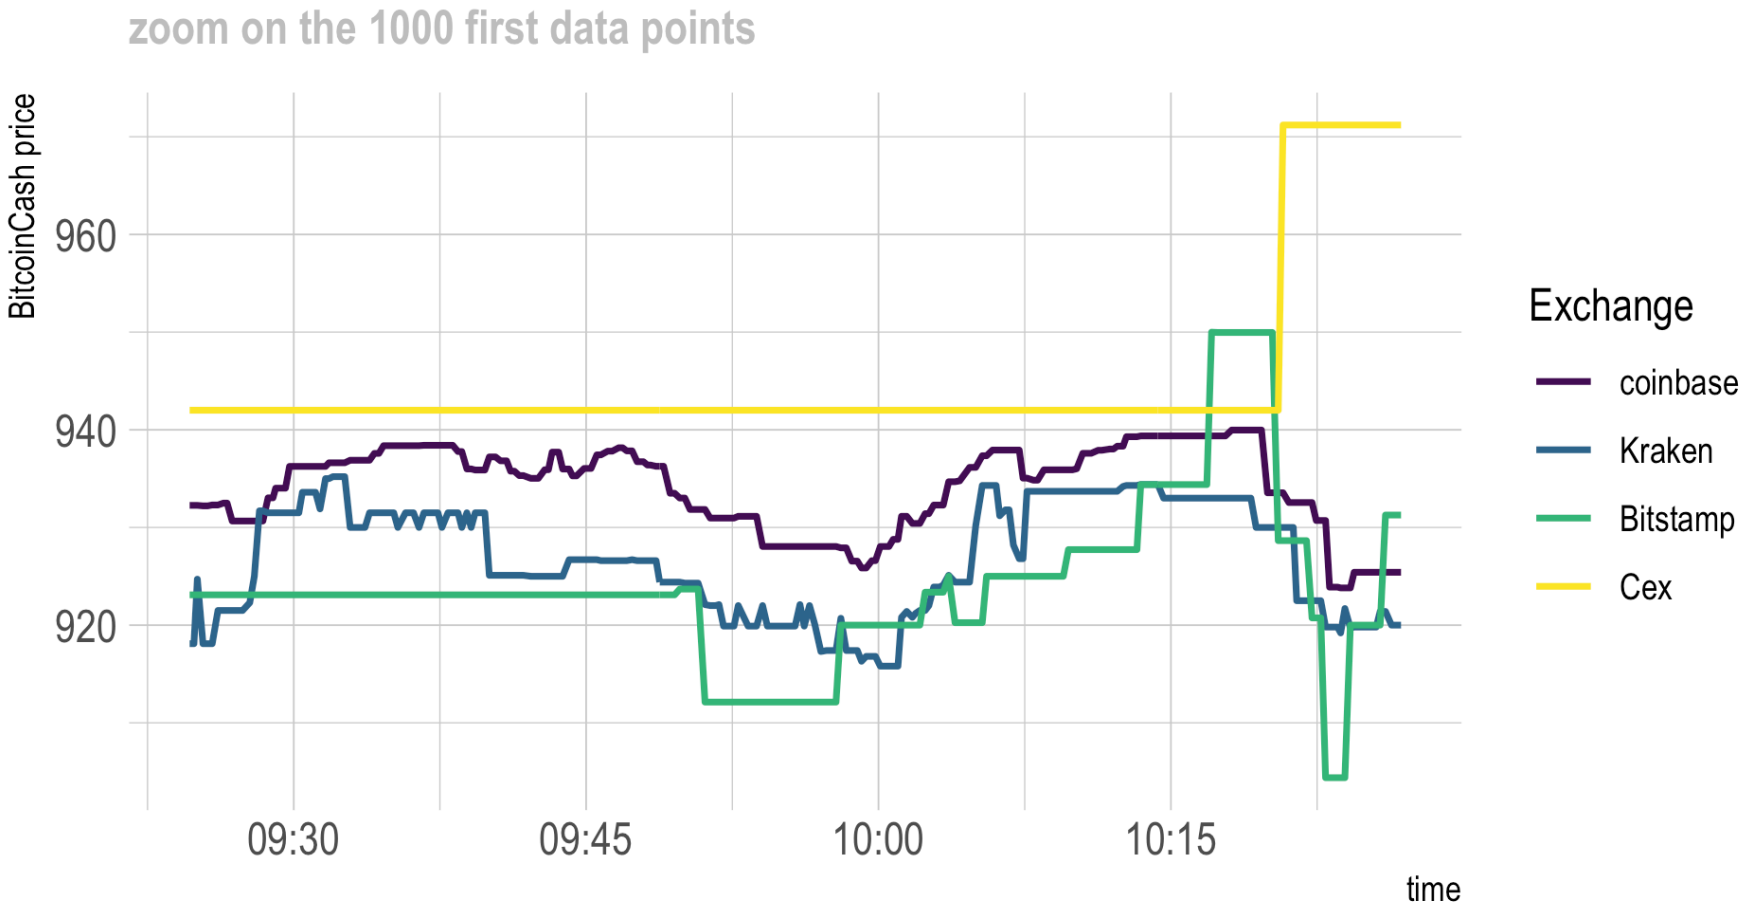
- Do it for **5 exchanges**, **5 currencies**, every 4 seconds, for **2 weeks**

- Get about **800,000 data points**

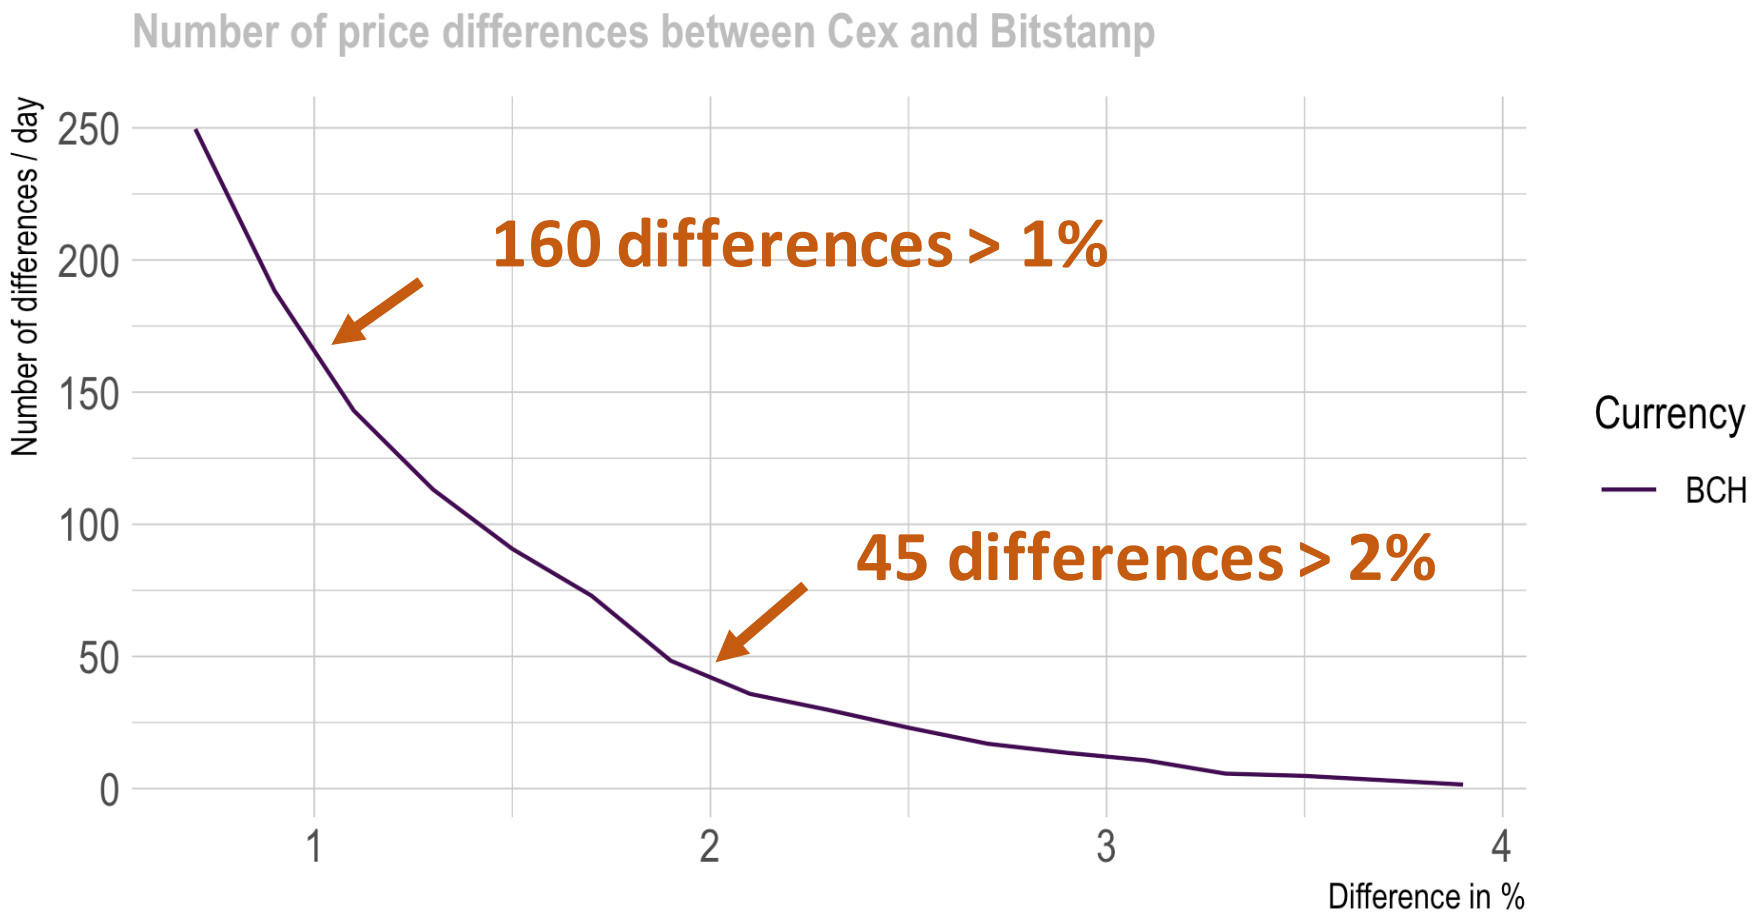
Prices are highly correlated among exchanges



But a few differences exist



How many differences ?



Running an arbitrage bot – for real

Bitcoin cash | Bitstamp vs Cex | 7 days | 400 euros invested

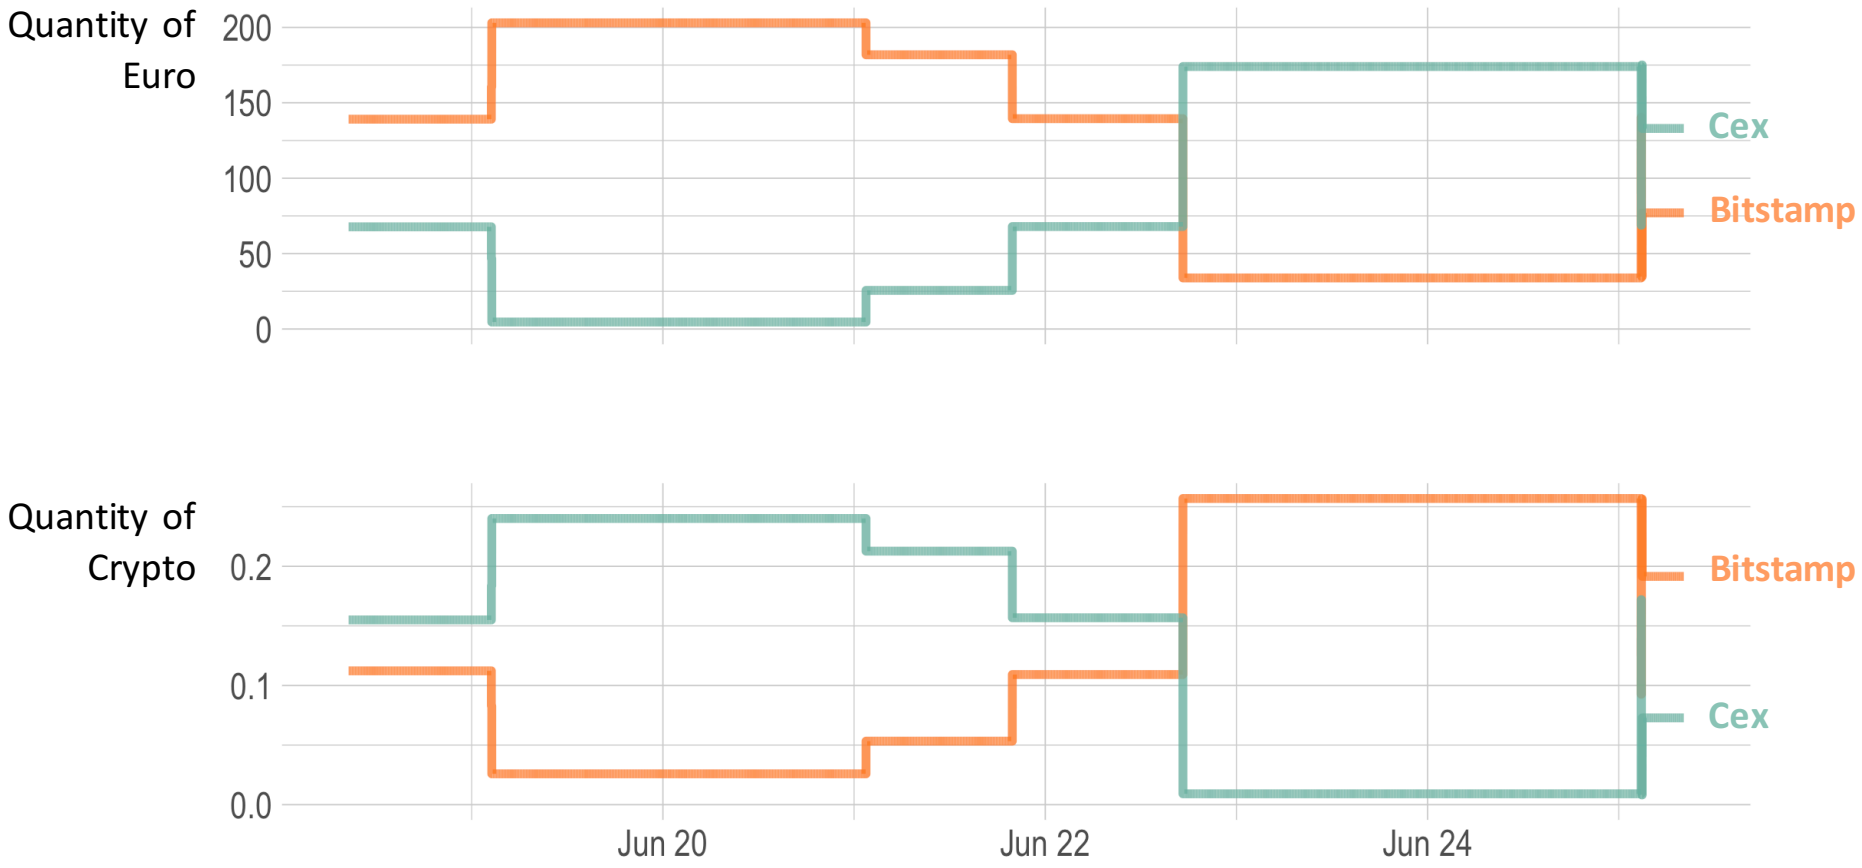
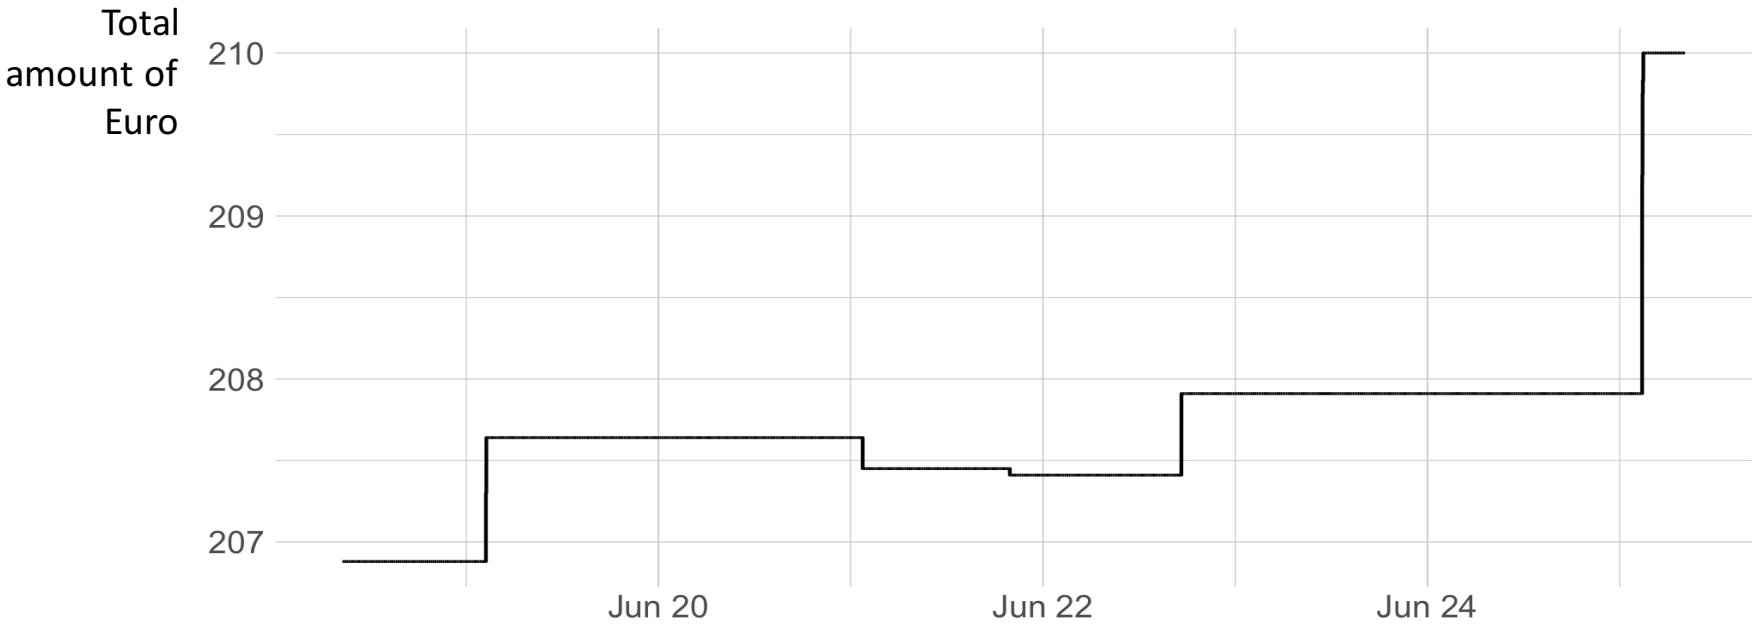
Evolution of Euro / Crypto accounts



Benefit

1.21 Euros | 0.3% of initial investment | 0.04% a day | 15% a year



Take Home

- Arbitrage = hard: fees + few differences + many other bots
- Getting even worse
- R makes the job!
- Functions available if you want to give it a try
